Team UX Designer, UI Designer, Managing Director, Software Development Manager

My Role Research, UI, Proof of Concept built in VueJS

Context

Northern Gas and Power has built one of the largest, dependable networks in the utility sector. They provide expert and disciplined advice in procurement, energy services, and technology. To complete their already big offer, the company invested in R&D to develop a set of IoT sensors and software to analyse and manage the distribution of consumption from yearly range down to millisecond (RT).

Challenge

The biggest challenge with ClearVue is related to data visualization:

- a) the complexity and amount of details to be displayed in small widgets.
- b) the software is destined to different roles and different skillsets, from the technical personnel who will check data on a site while running an intervention, to the sales agent or the factory owner.

Solution

After a quick survey ran with both persona types, it immediately came out that the huge difference in requirements from the different end users was a show stopper. This obliged us to split the product in 2 different ones: **ClearVue Alpha** which is destined to technical users and **ClearVue Beta**, which is suitable for non-technical users.

I've been involved in the process for ClearVue Beta, which is the mission-critical product for the sales department and was requiring a discrete amount of research on data visualization, widgets and customer knowledge about utilities.
