

From the list of widgets designed, I wish to analyse deeply the RAG Rate clock, in my opinion, the most interesting one. The problem to solve by this widget was: "how we can make customers understand their high consumption happening in the wrong RAG period and then apply changes based on the data they are seeing?".

The RAG Rate clock is applying the correct RAG period based on the location in the UK. Having a quick look at this widget, the user can immediately get an understanding about the realtime consumption, total consumption over a period and so he will be able to plan heavy consumptions to different day times, definitely worth to save money.
