

Approach

1

Research

The research started with a market analysis, including also competitors and user behaviours when paying and managing utilities.

Not so many people have a proper understanding of the daily cost phases Red Amber Green, and the importance of those when you want to reduce the cost you are paying in utilities.

The difference in knowledge from end-users will kill the idea of going live with a single product targeting 2 personas.

Deliverables

Field studies
User interviews
Personas

2

Design and Prototyping

The data gathered allowed me to design quickly the first set of Lo-Fi Wireframes, which got almost all rejected.

The second iteration set the direction for the widgets and the dashboards to be filled with them.

I quickly prototyped few widgets to see how they were performing live, and after some pain-point solved the design was ready to be converted in a PoC

Deliverables

Concepts for widgets
Lo-Fi Wireframes
Hi-Fi Wireframes
Widget Prototypes

3

Proof of Concept using VueJS

The widgets have been built using VueJS as codebase and D3js as chart library. The scope for the PoC was to have working widgets invoking real API on an editable dashboard. After 5 weeks working on it creating logics to feed the charts in realtime and developing the widget itself, the PoC took life and I finally connected the developed design to real API and it was working exactly as expected!

Deliverables

Proof of Concept
