

Approach

1

Tracking system

First step in this process has been the setup of GTM, GA and write down: the name convention for and strategy to map all the acquisition channels and the dozen of campaigns, the dataLayer and the guidelines for developers in order to implement the solution as required. Last but not least, I set up communications between containers using Zones, a built in functionality from GTM.

Deliverables

- User Journey maps
- Brand mapping
- UTM naming convention
- dataLayer.push()
- Events mapping
- Tracking strategy

2

Data display

I find Google DataStudio a perfect companion when treating different data sources. It allows you to connect with zero stress almost everything, including databases. This latest piece is important for the outcome, it enabled me to combine data from data warehouse and analytics. User level data combined with click level data.

Deliverables

- Data Studio Dashboards
- Guidelines for tracking

3

Optimizing Snapchat funnel

I've deeply analysed the data coming from the fresh tracking system just built, which highlighted several painpoints in the conversion funnel live at that moment. First of all the CTA were misleading, leaving the impression the very next step would be the last one, while in reality the user was obliged to pass by a middle step on a landing page, that was explaining the promotion in details. I removed the 2 main issues and tested the solution, which was then performing with a CTR per specific campaign of ~38% (~9% before the optimization)

Deliverables

- New conversion funnel
