GA - Global - UTM Rules

1. Instructions

In this sheet you can find all information about the usage of UTM parameters to tag campaign links manually. The usage of AdWords and DoubleClick (GMP) with an automatic tagging is preferable.

The UTM parameters answer the following questions:

How?	utm_medium	How do my visitors get to my website?
Where?	utm_source	Where are my visitors coming from?
Why?	utm_campaign	What is the campaign objective?
What?	utm_content	What is the ad/link about?

2. Golden Rules

For all manual tagged campaign links the following Golden Rules must be observed:

- ✓ Only use lowercase characters
- ✓ All information have to be separated by a under score "-"
- ✓ Blank spaces have to be replaced by a dash "-"
- ✓ As far as possible, all campaign information have to be provided in English
- ✓ Umlauts and accents are not allowed. Special characters have to be encoded in accordance with the ASCII Encoding Reference: https://www.w3schools.com/tags/ref_urlencode.asp
- ✓ It is not permitted to use UTM parameters for internal website links, e.g. Website A -> Website A
- ✓ Use URL shortener as far as possible, especially recommended/necessary for QR codes links

3. Convention

utm_source = **<source>** & utm_medium = **<medium>** & utm_campaign = **<campaign name>** **<quarter>** **<year>** & utm_content = **<ad size>** or **<ad format>** & utm_term = **NOT-USED**

<source> Predefined; mandatory; Contains depending on the medium the domain of the source website (without www.) or a predefined value of the channel grouping table below.

<medium> Predefined; mandatory; Contains one of the mediums that is described in the channel grouping table below.

<campaign name> Predefined; mandatory; Contains the name of the campaign defined by the agency.

<quarter> Custom; Optional; Contains the quarter that the ad was served.

<ad size> Custom; optional; Contains the size of the ad served.

<ad format> Custom; optional; Contains the format of the ad served.

GTM - Global - Naming Convention

1. GTM Workspaces

Convention: **<team>** - **<user>** - **<description>**

<team> Dynamic; optional; contains the (shortened) name of the team/brand/agency that the user that made the change belongs to.

<user> Dynamic; mandatory; contains a (shortened) name of the user within the team that created/published the changes to this workspace.

<description> Predefined; mandatory; contains a short and easy to understand description for the goal achievement.

Description: The workspace name starts with the team/brand/agency name followed by a blank, a dash, a blank; the initials/full name of the user that created/published the workspace followed by a blank, a dash, a blank; and ends with a short description describing the main changes in the workspace. It is highly recommended to use a new workspace for each change.

Examples: **JF - LF - Add scroll depth tracking**
GENESIS - AC - Add Facebook like button tracking
JF - FM - Adjust outgoing link tracking

2. GTM variables

Variable type	Naming convention structure	Examples	Notes
HTTP Referrer	HTTP - ((Type)) - ((Optional exactly what))	HTTP - Query - keyword HTTP - Path	In this example, the variable pulls the 'keyword' query parameter from the URL.
URL	URL - ((Type)) - ((Optional exactly what))	URL - Host Name URL - Query - keyword	In this example, the hostname is pulled from the URL. Notice how the optional third part of the variable name is not needed, as the second part provides all the information.
1st Party Cookie	Cookie - ((Name of Cookie))	Cookie - lastTransactionDate Cookie - _ga	In this example, a cookie called 'lastTransactionDate' is being read. Notice how the cookie name is capitalised in exactly the same way as the cookie itself.
Custom JavaScript	CJS - ((Short description of what it does))	CJS - Accordion Name CJS - CSV Product Names	In this example, the custom javascript pulls the test of an accordion HTML component on the page. Make your descriptions readable and concise.
Vars I over Variables	RI V - ((Variable name))	DLV - e-commerce detail products 0 name RI V - user email	In this example, the name of a product is pulled from GA's Enhanced Ecommerce data layer format. Names should reflect the path of the variable in this data layer and has in normal case lowercase initials.
