

Company **Legolas Invest Limited**

Industry **Lotteries and Gaming**

Website **www.legolas.bet**

Team **UX Designer, 3x UI Designer, 2x Trotting Analyst**

My Role **I've been leading the project in all its aspects from the idea's conception of a new pool game with social features, until the final delivery.**

Context

The company's biggest competitor, the Swedish company ATG, at that time was leading the market of pool betting in Sweden. One of the most interesting product from ATG is a team betting game **Tillsammans**, which allows customers to place bets in teams rather than as single bettor.

Challenge

Increase the pressure on the ownership of Swedish market, design a game to compete with the most played game from ATG. Improve the original product where possible.

Solution

The team decided to not clone the game itself, it was too far away from our way to work. Instead we took some of the interesting features we spot on Tillsammans, then we mixed those with other known products such as Syndicate Bet, which was opening way more possibilities to improve the product from ATG.

The product improvement saw the addiction of two functionalities to the game: possibility to build teams and manage them, possibility to chat in real-time with other team members.
