

Company **Shop and Deliver Limited**

Industry **Lotteries and Gaming**

Website **www.betika.com**

Team **UX Designer, UI Designer, Country Manager, CTO, Head of Frontend**

My Role **Research, Design Sprint Facilitator, Final Design**

Context

Betika is an online gambling website operating mainly in Kenya and the Eastern African continent owned by Shop and Deliver Limited, a company based in Nairobi and having Kenyan shareholders. The product was losing the grip on the market due to several problems related to user experience. Mostly related to bad design decisions which led the development to a not enjoyable and expensive to use the product.

Challenge

The product is targeting emerging markets in Africa, including Kenya, Mozambique, Zambia, DRC and Tanzania. The biggest problem in this scenario is the cost of mobile data. For instance, in Mozambique 1GB of mobile data can easily cost \$15.82 (Ksh 1,605.57). From here the necessity to have a web product, solid, reliable and enjoyable for those who cannot afford to pay such amount of money to surf on the internet.

Solution

The solution applied involves changes in both design and development strategies. The outcome of the research highlighted how customers are sensitive to data cost, but also how important is for them to have also a fully-fledged betting solution.

Design-wise, thanks to the Design Sprint workshop, the team highlighted the most impacting features for our main issue and then validated solutions.

For the home page, the biggest change has been: moving from the full list of all possible sports to one single sport, adding the infinite scroll functionality, to give the customers the feeling that they are not missing any match.
