

Process

1

Research

The guiding force for the project has been gathering as many details we could about available games, customer interest in a new product combining pool betting and soccer (there was nothing similar in 2017 in the market). The final step we decided to do, a guerrilla survey in a horse racing track, gave us the final tips to get a real understanding of the feasibility and build the rules for our new game.

Deliverables

- Competitor analysis
- Initial game rules
- Market study
- Survey

2

Problem framing and resolution

I started scratching a draft for the storyboard, then it was the time of Lo-Fi wireframes for the Information Architecture approval and then, once approved, I designed the Hi-Fi wireframes to be used in the following prototyping step.

Deliverables

- Lo-Fi Wireframes
- Hi-Fi Wireframes

3

Prototyping and testing

The prototype I built was allowing any possible interaction with the product, this due to the fact I didn't have the approval to run the planned sessions of Usability Test, so everything should go in one single run. I gave to the 5 users in the single session, a fully testable UI to play with. The test pointed out an issue related to a missing detail, count down to the stop of bet acceptance. Fixed it the company went for the planning and development.

Deliverables

- Prototype
- Usability test report
- Project validation
