

Applying a single sport as a filter and reducing the number of listed events to 50, killed the consumption of data, which was mostly related to the match details loaded for thousands of events, this without impacting the overall experience as from data we knew that 87% of customers are soccer only bettors.

A revamped navigation has been required to satisfy the pulsing request from customers to have sports events that can be found easily and at the same time access also other verticals which were hidden or not quickly accessible.

An Omniseach which works across all sports verticals helped the navigation in the heavy-duty of making accessible thousands of sports events.

Development wise, the app has been rebased, moving from Angular 4 to a lightning-fast VueJS codebase. The app bundle draped from 6.8Mb to 1.76Mb.

The makeover involved also some new setup for the server, which now applies Gzip and Brotli compression.
