

Approach

1

Research

When starting a new project in a new market you never worked with, the research phase is mission-critical.

The data gathered from the qualitative and quantitative research highlighted different problems from the ones pointed out by the owners. It was clear the issues were: the users are sensitive to data consumption, it is difficult to find a specific event or competition, the website not easy to navigate.

Deliverables

Stakeholder interview
Competitor Analysis
NPS
User Interview
Empathy map
Clustering
User Flow
User Journeys
User Persona
Heuristic Analysis
Field Studies

2

Problem framing and resolution

To save time and have a good solution quickly, we applied the Design Sprint methodology from Google Ventures.

Day 1: Guiding goals, questions, targets

Day 2: Remix and improve, sketches

Day 3: Decide, rumble, storyboard

Day 4: Prototyping

Day 5: Testing

Deliverables

Day 1: Problem to solve
Day 2: Possible solutions
Day 3: Ideas votation
Day 4: Prototypes
Day 5: Data, Validation
Lo-Fi Wireframes
Hi-Fi Wireframes

3

Prototyping and testing

Starting from the Hi-Fi wireframes, I worked a prototype, so validating the solution could be possible avoiding any development. We tested all the analysed journeys and the result has been interesting. The task completion rate, the metric we fixed as main, increased drastically from 43% to 91%. The lower limit to approve the idea has been fixed to 90% of completion rate. The tested solution got the approval from the owners and the product has been developed as per new requirements.

Deliverables

Prototype
Usability test report
Heuristic analysis
Project validation
